

I started out in Amateur Radio at the age of 10years old in Kentucky with my uncle. At that time noise on the amateur bands were at a minimal level especially in the small town partly in the backwoods of western Kentucky. For a black family this was a very important link to the outside world.

What you are proposing with BPL technology will send many if not most of the amateurs and other civil services that utilize the 2 to 80MHz frequencies seeking areas of the country where they can hopefully hear signal other than the interference that will surely be produced by this technology.

Other countries have tried this with out success. Why are we here in America seeking to reinvent the wheel.

ARRL I think with its proven track record has demonstrated that the technology will cause harm to Homeland Security, Dept of Defense, National Guard and the list is endless including private business.

I urge and implore you to keyhold this technology due to the above. Thanking you in advance..Sincerely Bill Brown K0UK
